Description

Field Of The Invention

The present invention relates to an insufflation cannula assembly adapted to receive a trocar, endoscope or other surgical instrument and for use in conjunction with insufflatory surgical techniques, and more particularly relates to a valve used in the assembly for maintaining insufflation pressure in a body cavity.

Description Of The Prior Art

Insufflatory surgery involves filling a body cavity with a pressurized gas to maintain the cavity under a certain predetermined pressure. One way of performing the surgery is by first puncturing the skin in a desired body cavity region with a needle. The needle includes a stylet which introduces an insufflation gas into the body cavity to inflate it.

A trocar is then used to puncture the body cavity. The trocar is inserted through a cannula or sheath, which cannula partially enters the body cavity through the incision made by the trocar. The trocar may then be removed from the cannula, and an elongated endoscope may be inserted through the cannula to view the anatomical cavity.

Various types of cannula or trocar assemblies are provided with valves for maintaining a certain gas pressure in the cavity when the trocar or other surgical instrument is removed from the cannula.

For example, U.S. Patent No. 4,654,030 discloses a trocar assembly having a cannula and employing a flapper valve to close off the cannula passage after the trocar or other instrument has been withdrawn.

As shown in Fig. 7 of the Moll et al. patent, the flapper valve includes a U-shaped flapper 82 and a grommet 77 formed with a central opening 78 through which the trocar may be inserted or withdrawn. The flapper carries a circular pad 87, and is spring-biased so that the pad engages grommet 77 and forms a seal with the grommet.

Although the flapper valve disclosed in the Moll et al. patent works well in most applications to maintain pressure in the body cavity, there are certain inherent drawbacks in its design.

First, the circular pad is rigidly mounted on the flapper so that it cannot move with respect to the flapper. If the pad and grommet are slightly out of alignment when the valve closes, the pad may not seat properly on the grommet, and insufflating gas may leak from the body cavity through the valve.

Second, the circular pad is made of a deformable material such as Tygon (TM), and is formed by a molding process. Irregularities in the pad's grommet-engaging surface due to shrinkage of the

pad material during its formation may provide leakage paths through the valve. Also, the pad bears with considerable spring pressure on the side of the trocar when the trocar is inserted into the cannula through the valve. A depression may form in the pad's surface which may cause further leakage when the valve closes.

Third, the circular pad is relatively flat or has a slight curvature. It engages protruding lips 88 formed on the grommet, which lips surround the grommet opening 78. With this structure, the flapper valve disclosed in the Moll et al. patent provides minimal contact area between the pad and the grommet, and any slight irregularity in one or the other may cause the valve to leak.

OBJECTS AND SUMMARY OF THE INVENTION

It is an object of the present invention to provide a valve for an insufflation cannula assembly which minimizes fluid leakage through the cannula.

It is another object of the present invention to provide a flapper valve whose sealing members automatically align with each other when the valve closes to provide an enhanced gas tight seal.

It is a further object of the present invention to provide a flapper valve whose sealing members contact each other over a greater surface area.

It is yet another object of the present invention to provide an insufflation cannula assembly for use with a trocar, endoscope or other surgical instrument, which cannula assembly provides negligible or no gas leakage.

It is a still further object of the present invention to provide a flapper valve which is an improvement over the flapper valve disclosed in Moll et al. U.S. Patent No. 4,654,030.

In one form of the present invention, a cannula assembly for use in conjunction with insufflatory surgical techniques includes a cannula having opposite open ends, a housing mounted on one end of the cannula and having an opening formed in the housing, and a flapper valve mounted in the housing to seal the cannula passage when a surgical instrument, such as a trocar, endoscope or the like, is withdrawn from the cannula.

The flapper valve basically includes a valve seat situated at the housing opening, a valve plug which engages the valve seat and forms a substantially fluidtight seal with the seat, and a support plate and spring mechanism for mounting the valve plug in the housing and for pivoting the plug into and out of engagement with the valve seat.

The valve seat has an opening formed through its thickness, which opening is in communication with the cannula passage. The valve seat is positioned in the housing such that its opening is coaxial with the cannula so that a surgical instru-

ment, such as a trocar or endoscope, may be inserted through the valve seat opening and into the cannula passage.

The valve plug is mounted loosely but securely on the support plate so that it can move radially on a surface of the support plate and align itself with the opening formed in the valve seat when the two engage each other. The surface of the valve plug which engages the valve seat has a frusto-conical shape so that the surface is partially received by the valve seat opening when the valve closes.

The support plate is basically a U-shaped member which extends from the radial side of an upstanding post mounted in the housing. A helical spring mounted co-axially on the post engages the housing and the support plate and biases the valve plug into engagement with the valve seat. A trocar or other surgical instrument inserted through the valve seat opening will cause the valve plug to pivot away from the valve seat and out of the trocar's axial path of travel between the valve seat opening and the cannula passage.

Preferred forms of the flapper valve and insufflation cannula assembly, as well as other embodiments, objects, features and advantages of this invention, will be apparent from the following detailed description of illustrative embodiments thereof, which is to be read in connection with the accompanying drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is an isometric view of the cannula assembly of the present invention with a trocar assembly mounted thereon.

Fig. 2 is a sectional view of the cannula assembly and trocar assembly shown in Fig. 1, taken along line 2-2 of Fig. 1.

Fig. 3 is an exploded view of the cannula assembly of the present invention.

Fig. 4 is an isometric view of the cannula assembly shown in Fig. 3 with its housing partially broken away.

Fig. 5 is a rear perspective view of a portion of the cannula assembly.

Fig. 6 is a partial sectional view of the flapper valve used in the cannula assembly of the present invention.

Fig. 7 is a top view of the cannula assembly with its housing partially broken away.

Fig. 8 is an enlarged, detailed view of a portion of the flapper valve of the present invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Referring initially to Figs. 1 and 2 of the drawings, it will be seen that a cannula assembly 2

used in connection with insufflatory surgical techniques basically includes a cannula 4 and a housing 6 mounted on one end of the cannula 4. The cannula 4 is formed as an elongated sleeve having opposite proximate and distal open ends, and thus defines a cannula passage 8 in its interior. The cannula 4 may be formed from a stainless steel or other rigid material.

The housing 6 of the cannula assembly is rigidly secured to the proximate end of the cannula 4. It has an open interior for mounting other components of the cannula assembly, and has a rear opening 10 defined by a circular flange 12 extending inwardly of the housing, which opening 10 is situated co-axially with the cannula 4. An O-ring 13 (see Fig. 3) may be mounted on the cannula 4 to prevent leakage between the cannula and the housing. Additionally, the housing 6 includes a stopcock port 14 into which the nozzle of a stopcock 16 is inserted (see Fig. 4), the port 14 being provided for passing additional insufflating gas into the body cavity.

The cannula assembly 2, with its cannula 4 and its housing 6, is adapted to receive a surgical instrument through the opening 10 in its housing. An example of such an instrument is the trocar assembly 20 shown in Figs. 1 and 2 of the drawings, the trocar assembly being mounted on the rear side of the housing 6.

The trocar assembly 20 basically includes a hand grip portion or head 22, an obturator 24 mounted on the head 22 of the trocar assembly and extending outwardly from the head, and an obturator shield 26 which houses the obturator 24. The obturator 24 is formed with a piercing tip 28 for puncturing the body cavity. A spring 30 in the head 22 of the trocar assembly biases the shield 26 axially away from the head so that it covers the obturator tip 28.

The trocar assembly 20 is mounted on the cannula assembly 2 so that its obturator 24 and shield 26 are slidably received in the cannula passage 8 with the obturator shield extending beyond the distal end of the cannula 4.

In operation, the distal end of the cannula/trocar assembly is placed against the skin at the body cavity region, and pressure is exerted on the assembly against the skin. This pressure causes the obturator shield 26 to be pushed rearwardly against the force of the spring 30 to a retracted position, thereby exposing the piercing tip 28 of the obturator. The tip enters the skin and underlying tissue with continued pressure. Once the tip has penetrated the tissue and has entered the cavity, the force against the distal end of the shield 26 ceases and the shield is automatically moved axially forward to its extended position covering the tip 28 through the action of the spring 30.

A more detailed description of the trocar assembly described herein, and its operation, is provided in Moll et al. U.S. Patent No. 4,654,030.

As is provided in the device disclosed in the above-identified Moll et al. patent, the cannula assembly 2 of the present invention includes a flapper valve which opens to allow a surgical instrument, such as the trocar assembly 20, to be inserted through the cannula 4, and closes when the surgical instrument has been withdrawn, in order to maintain gas pressure in the body cavity which has been inflated with an insufflation gas. The flapper valve of the present invention as shown in Fig. 3 basically includes three components: a valve seat 32, a valve plug 34 which engages the valve seat 32, and a mechanism 36 for mounting the valve plug 34 and for pivoting the plug into and out of engagement with the valve seat 32.

As shown in Figs. 3 through 8 of the drawings, the valve seat 32 is mounted in the circular flange 12 at the rear opening 10 formed in the housing 6 of the cannula assembly. The seat 32 basically includes a forward portion 38 and a rearward portion 40 which are interconnected and which define a recess 42 between them, which recess 42 receives the circular flange 12 of the housing. The rearward portion 40 is preferably circular, and is received in a recess 44 formed in the circular flange 12.

The forward portion 38 is substantially rectangular, and has a greater transverse width than the diameter of the circular rearward portion 40 so that it extends substantially to the opposite lateral sides 46 of the housing 6. The forward and rearward portions 38, 40 contact the sides of the flange over an area sufficient to prevent leakage.

The valve seat 32 includes an opening 48 formed centrally through its thickness. The valve seat 32 is situated in the housing 6 so that its opening 48 is co-axial with the cannula 4 and is in communication with the cannula passage 8 through the interior of the housing; this will allow a surgical instrument, such as the trocar assembly 20 shown in Figs. 1 and 2, or an endoscope, for example, to pass through the valve seat opening 48 and into the cannula passage 8 from the rear side of the cannula assembly housing 6.

A portion of the valve seat 32 surrounding the opening is reduced in thickness. This portion is defined by a circular recess 50 formed in the rearward portion 40 of the valve seat, and a recessed groove 52 formed in the surface of the forward portion 38 of the valve seat and concentrically surrounding the opening 48.

The valve seat 32 is formed from a rubber or other elastic material. As will be seen, because of the elasticity of the material from which it is formed and the reduced thickness of the area surrounding

the opening 48, the valve seat 32 will deform to accommodate the valve plug 34 and thereby conform to the shape of the valve plug 34 when the two engage each other, with substantial areas of the two being in contact so as to form a substantially gas tight seal. Also, the reduced thickness portion at 50 and 52 surrounding the valve seat opening 48 allows the valve seat 32 to expand and closely engage the obturator shield 26 of the trocar assembly 20 or other surgical instrument inserted in the cannula assembly, and to prevent fluid from escaping from the body cavity.

As mentioned previously, the flapper valve also includes a mechanism 36 for mounting the valve plug 34 and for pivoting the valve plug into and out of engagement with the valve seat 32. As shown in Fig. 3 of the drawings, such a mechanism includes a support plate 54 which is preferably U-shaped. The support plate 54 extends outwardly from a radial side of an upstanding post 56 mounted in the housing 6 of the cannula assembly.

A tensioned helical spring 58 is co-axially mounted on the post 56, and includes two ends 60, 62. One end 60 bears against a side 48 of the cannula housing 6, and the other end 62 bears against the rear side 63 of the support plate below a tab 64 extending outwardly from the rear side, which tab 64 keeps the spring end in place. The spring 58 biases the support plate 54 such that the valve plug 34 mounted on the plate will engage the valve seat 32 to effect a gas tight seal.

When a trocar or other surgical instrument is inserted through the valve seat opening 48 into the housing 6 of the cannula assembly, it will engage the valve plug 34 and cause the support plate 54 to pivot against the force of the spring 58 towards the side 48 of the housing so that the valve plug 34 is out of engagement with the valve seat 32. This opens the valve and allows the surgical instrument to be inserted through the interior of the cannula assembly housing 6 and into the cannula 4. When the trocar or surgical instrument is withdrawn, the support plate 54 is spring biased to pivot so that the valve plug 34 will automatically engage the valve seat 32, thereby closing the valve.

A lever 66 is provided on the outside of the housing 6. The lever 66 is mounted to the upstanding post 56 and pivots with the post. The lever 66 is provided for the surgeon to manipulate so that the valve can be manually opened to desufflate the body cavity. To ensure fluidtightness, an O-ring 68 is mounted on the post between the spring 58 and the lever 66.

The support plate 54 also has an opening 70 formed through its thickness, that is, between its rear and front sides 63, 65. As will be seen, the opening 70 is provided for mounting the valve plug 34 to the support plate.

As seen in Fig. 8, the valve plug 34 of the flapper valve basically includes a front face 72 and a rear face 74 opposite the front face. A portion 76 of the front face is formed with a conical shape, and more preferably, a frusto-conical shape. The conically-shaped portion 76 of the valve plug is preferably sloped inwardly on its sides at an angle A of about 30°.

The front face 72 of the valve plug is also formed with a flange 78 which surrounds the conically-shaped portion 76. Flange 78 acts to ensure that the tip of shield 26 of the trocar assembly, or other surgical instrument which may be inserted, is guided into the cannula 4 and does not momentarily get hung up at the joint formed by valve plug 34 and support plate 54.

As mentioned previously, the valve plug 34 is mounted on the support plate 54 and pivots with the support plate into and out of engagement with the valve seat 32. One of the important features of the flapper valve of the present invention which distinguishes it from the valve employed in the trocar disclosed in U.S. Patent No. 4,654,030 (Moll et al.) is that the valve plug 34 is loosely but securely mounted on the support plate 54 so that it can move radially to a certain extent on the front face of the support plate. The ability of the plug 34 to move with respect to the support plate 54 and the particular shape of the valve plug (i.e., conical or frusto-conical) provide the valve plug with a self-seating capability which allows it to automatically align itself with the valve seat 32 when the two engage.

A stem portion 80 extends outwardly from the rear face 74 of the valve plug 34. As will be seen, the stem portion 80 is provided for mounting the valve plug 34 to the support plate 54, and for providing the valve plug with a degree of radial movement on the front side of the support plate.

The stem portion 80 may include a free end on which is mounted a retaining head 82. Additionally, the retaining head 82 may form the free end of the stem portion 80. The retaining head 82 in its preferred form is also frusto-conically shaped with sides that converge in a direction away from the rear side 63 of the support plate, preferably sloping inwardly at an angle B of about 20°.

The valve plug 34 is mounted on the support plate 54 with its conically-shaped front face 72 and its retaining head 82 disposed on opposite front and rear sides 65, 63 of the support plate, respectively, and with its stem portion 80 received by the support plate opening 70.

The retaining head 82 is made oversized, that is, with a diameter that is greater than that of the support plate opening 70, to securely connect the valve plug 34 to the support plate 54. However, the stem portion 80 of the valve plug is formed with a

diameter that is less than that of the support plate opening 70. Thus, when mounted on the support plate 54, the valve plug 34 is free to move in any radial direction on the front side 65 of the support plate, and is limited in its radial movement by the difference between the diameters of the support plate opening 70 and the stem portion 80.

For example, if the support plate opening 70 is formed with a diameter of 3.2mm (.127 inches) and the valve plug stem portion 80 is formed with a diameter of 2.4mm (.095 inches), then the valve plug will be able to travel 0.4mm (.016 inches) from the center of the support plate opening in any radial direction.

The valve plug 34 is thus free to "float" on the surface of the support plate 54 in any radial direction, and to align itself with the central opening 48 formed in the valve seat 32. When the valve closes, the engagement of the valve seat 32 with the frusto-conical front face of the valve plug 34 forces the valve plug into proper alignment with the valve seat to effect a gas tight seal.

The rear face 74 of the valve plug 34 is also formed with a recessed portion 84 concentrically surrounding the stem portion 80. This recessed portion 84 is provided basically for two reasons. First, it provides the plug with less surface area on its rear face 73 to contact the front side 65 of the support plate. This reduces the drag or friction between the two and allows free movement of the valve plug 34 on the support plate 54.

Second, if desired, the recessed portion 84 may serve to receive a silicone grease or other lubricant to lubricate the interface between the valve plug and the support plate, which also minimizes friction between the two.

If desired, the front face 72 of the valve plug 34 may be formed from an inelastic material such as a plastics material aluminum, stainless steel or the like. The retaining head 82 may be formed from the same or other material as the front face 72 of the valve plug and joined to the end of stem portion 80 after the stem portion has been mounted in the support plate opening 70, or may be formed from an elastic material and force-fitted through plate opening 70. The retaining head 82, formed of elastic material, can compress and then expand after its insertion through the support plate opening, and thereby return to an intentional interference.

The valve seat 32, being molded of rubber or other elastomeric material, conforms by stretching and compressing to the shape of the valve plug 34 when the valve plug is wedged in the valve seat opening 48. Thus, the valve seat surrounding the opening 48 can engage the valve plug 34 over substantially all of its entire thickness to form an effective gas tight seal.

The valve plug 34 may be mounted in a circular recess 86 (see Fig. 8) formed in the front side 65 of the support plate 54, the diameter of the circular recess 86 being made sufficiently large so as not to limit the radial movement of the valve plug on the support plate.

The flapper valve of the present invention provides an enhanced gas tight seal by its capability of being self-seating. More specifically, the frusto-conical shape of the valve plug 34 and its ability to "float" on the support plate 54 allow it to come into proper alignment with the valve seat 32 when the two engage. Furthermore, the configuration and elasticity of the valve seat 32 and the particular shape of the valve plug 34 permit the two to contact each other over a greater surface area, thus ensuring an effective seal.

Claims

1. A flapper valve for an insufflation cannula assembly, the cannula assembly (2) including a cannula (4) defining a cannula passage (8) and a housing (6) mounted on one end of the cannula (4) and having an opening (10) formed therein, the flapper valve being mounted in the housing (6) of the assembly (2), the flapper valve comprising:
 - a valve seat (32) situated at the housing opening (10), the valve seat (32) having an opening (48) formed therein, the valve seat opening (48) being in communication with the cannula passage (8) and being adapted to allow a surgical instrument to pass therethrough and into the cannula passage (8);
 - a valve plug (34), the valve plug (34) being adapted to engage the valve seat (32) at the opening (48) thereof and to form therewith a substantially gas tight seal;
 - biasing means (58) for biasing the valve plug (34) into engagement with the valve seat (32); and
 - means (36) for mounting the valve plug (34) in the housing (6) and for pivoting the plug (34) into and out of engagement with the valve seat (32), characterised in that the valve plug (34) is movable on the plug mounting means (36) so as to be self-aligning with the valve seat opening (48) when the plug (34) and seat (32) are in engagement.
2. A flapper valve as claimed in claim 1, wherein the valve plug (34) has a front face having a frusto-conically shaped portion (76) which engages the valve seat (32).
3. A flapper valve as claimed in claim 1 or 2, wherein the valve plug (34) includes a front face (72) which engages the valve seat (32), and a rear face (74) opposite the front face (72), and further includes a stem portion (80) extending outwardly from the rear face thereof; and wherein the plug mounting means (36) includes a support plate (54), the support plate having an opening (70) formed therein, the opening (70) being adapted to receive the stem portion (80) of the valve plug (34) to allow the plug (34) to be mounted on the surface of the plate, the diameter of the support plate opening (70) being greater than the diameter of the plug stem portion (80); and wherein the flapper valve further includes means (82) for securing the stem portion (80) within the support plate opening.
4. A flapper valve as claimed in claim 3, wherein the stem portion (80) of the valve plug (34) includes a free end; and wherein the plug (34) further includes a retaining head (82), the retaining head (82) being mounted on the free end of the plug stem portion (80), the retaining head (82) having a greater diameter than that of the support plate opening (70).
5. A flapper valve as claimed in claim 1 or 2, wherein the valve plug (34) includes a front face (72) which engages the valve seat (32), and a rear face (74) opposite the front face (72), and further includes a stem portion (80) extending outwardly from the rear face (74) thereof, the stem portion (80) having a free end, and a retaining head (82) mounted on the free end of the plug stem portion (80); and wherein the support plate (54) has two opposite sides (63,65) and has an opening formed (70) through the thickness thereof, the opening (70) receiving the valve plug stem portion (80) so that the retaining head (82) and front face (72) are disposed on opposite sides of the support plate (54), the diameter of the support plate opening (70) being greater than that of the stem portion (80) and being less than that of the retaining head (82).
6. A flapper valve as claimed in claim 3, 4 or 5, wherein the front face (72) of the valve plug (34) is formed from a substantially inelastic material.
7. A flapper valve as claimed in any one of the preceding claims, wherein the valve seat (32) is formed from an elastic material.
8. A flapper valve as claimed in claim 1 or 2, wherein the valve plug (34) includes a front face (72) having a conically-shaped portion

(76) and a flange (78) surrounding the conically-shaped portion (76), and further includes a rear face (74) opposite the front face (72), the front face (72) being adapted to engage the valve seat (32).

9. A flapper valve as claimed in any one of claims 3, 4 or 5, wherein the rear face (74) of the valve plug (34) includes a recessed portion (84).

10. A flapper valve as claimed in any one of claims 1, 2 or 8, wherein the plug mounting means includes a support plate (54), the support plate (54) being pivotally mounted in the housing (6) and having the valve plug (34) mounted thereon, and being biased to pivot the valve plug into engagement with the valve seat (32).

11. A flapper valve as claimed in any one of claims 1, 2, 8 or 9, wherein the valve plug (34) includes a stem portion (80) extending from a surface thereof, the stem portion (80) being loosely received in an opening (70) formed in the plug mounting means (36).

12. A flapper valve as claimed in any one of the preceding claims, wherein the valve seat (32) has a reduced thickness portion (50) surrounding the opening.

13. A flapper valve as claimed in any one of the preceding claims, wherein the valve seat (32) is situated in the housing (6) such that the valve seat opening (48) is co-axial with the cannula (4).

14. An insufflation cannula assembly (2), which comprises:

a cannula (4), the cannula having opposite ends;

a housing (6) mounted on one end of the cannula, the housing having an opening (10) formed therein; and a flapper valve mounted in the housing (6), the flapper valve including a valve seat (32) disposed at the housing opening (10) and having opening (48) formed therein to allow a surgical instrument to pass therethrough and into the cannula (4), a valve plug (34) adapted to engage the valve seat (32) at the opening (48) thereof and to form with the valve seat (32) a substantially gas tight seal; and means (36) for mounting the valve plug (34) and for pivoting the plug (34) into and out of engagement with the valve seat (32), and characterised in that the valve plug (34) is movable on the plug mounting means (36) so

as to be self-aligning with the valve seat opening (48) when the plug (34) and valve seat (32) are in engagement.

5 15. A flapper valve as claimed in any one of the preceding claims and wherein the valve seat (32) comprises:

10 a valve seat body (32) having formed therein a valve seat opening (48) adapted to allow a surgical instrument to advance therethrough, said opening being bounded by a peripheral lip (50), at least a portion (52) of said peripheral lip being of reduced thickness, said reduced thickness portion (52) thereby being of greater flexibility than adjacent portions of said valve seat, and being adapted to form a substantially gas tight seal with said flapper valve assembly.

20 16. A valve as claimed in Claim 15, wherein said peripheral lip is formed of a resilient material.

25 17. A valve as claimed in Claim 15 or 16, wherein the valve seat body is formed of a resilient material.

30 18. A valve as claimed in Claim 15, 16 or 17 and which is suitable to be incorporated in an insufflation cannula assembly which includes a cannula (4) defining a cannula passage (8) and a housing (6) mounted on one end of the cannula and having formed therein a housing opening (10) for the valve seat, the flapper valve in use being mounted in the housing of the assembly adjacent the housing opening, and the flapper valve including:

35 a valve plate (54) pivotally mounted in said housing, said valve plate having front and back faces (63), said front face of said valve plate being adapted to engage said peripheral lip of said valve seat, said valve plate including means (34) for obstructing said valve seat opening (48) when said valve plate engages said peripheral lip; and

40 biasing means (58) for biasing said valve plate into engagement with said peripheral lip of said valve seat;

45 whereby a substantially gas tight seal is effected between said valve seat and said valve plate when said peripheral lip of said valve seat engages said front face of said valve plate.

50 19. A valve as claimed in Claim 18, wherein said valve plate is substantially U-shaped.

55 20. A valve as claimed in Claim 18 or 19, wherein said valve seat engages the housing and is

maintained in position therein by a flange (12).

21. A valve as claimed in Claim 20, wherein said valve seat engages said flange over an area sufficient to prevent gas leakage therebetween.

22. A valve as claimed in any one of Claims 15 to 21, wherein said reduced thickness portion is adapted to conform to the shape of said obstructing means to form a substantially gas tight seal therewith.

23. An insufflation cannula assembly which includes a valve as claimed in any one of Claims 18 to 22 and which comprises:

a cannula (4) having opposite end portions;

a housing (6) mounted to one end of the cannula, said housing having a housing (10) opening formed therein the valve seat (32) being adjacent the housing opening, and the valve seat opening (48) being in communication with the cannula passage and being adapted to allow a surgical instrument to pass there-through and into the cannula passage.

Patentansprüche

1. Ein Klappenventil für eine Insufflationskanülen-Anordnung, wobei die Kanülen-Anordnung (2) eine einen Kanülendurchlaß (8) umschließende Kanüle (4) und ein Gehäuse (6) einschließt, das auf einem Ende der Kanüle (4) angebracht ist und eine darin ausgebildete Öffnung (10) besitzt, wobei das Klappenventil im Gehäuse (6) der Anordnung (2) angebracht ist, und wobei das Klappenventil umfaßt:

einen an der Gehäuseöffnung (10) angeordneten Ventilsitz (32), wobei der Ventilsitz (32) eine darin ausgebildete Öffnung (48) besitzt, wobei die Ventilsitzöffnung (48) mit dem Kanülendurchlaß (8) in Verbindung steht und angepaßt ist, um einem chirurgischen Instrument zu erlauben durch sie hindurch und in den Kanülendurchlaß (8) einzutreten;

einen Ventilstopfen (34), wobei der Ventilstopfen (34) angepaßt ist, um mit dem Ventilsitz (32) an der Öffnung (48) desselben in Eingriff zu treten und damit eine im wesentlichen gasdichte Dichtung zu bilden;

ein Vorbelastungsmittel (58), um den Ventilstopfen (34) in Eingriff mit dem Ventilsitz (32) vorzubelasten; und

eine Vorrichtung (36) zum Anbringen des Ventilstopfens (34) im Gehäuse (6) und zum Schwenken des Stopfens (34) in Eingriff mit dem Ventilsitz (32) und aus dem Eingriff heraus, dadurch gekennzeichnet, daß der Ventilstopfen (34) auf der Stopfenanbringvorrichtung

(36) beweglich ist, 50 daß er gegenüber der Ventilsitzöffnung (48) selbstausrichtend ist, wenn sich der Stopfen (34) und der Sitz (32) im Eingriff befinden.

2. Ein Klappenventil nach Anspruch 1, dadurch gekennzeichnet, daß der Ventilstopfen (34) eine Vorderseite mit einem kegelstumpfförmig gestalteten Teil (76) besitzt, welcher mit dem Ventilsitz (32) in Eingriff tritt.

3. Ein Klappenventil nach Anspruch 1 oder 2, dadurch gekennzeichnet, daß der Ventilstopfen (34) eine Vorderseite (72), die mit dem Ventilsitz (32) in Eingriff tritt, und eine zur Vorderseite (2) entgegengesetzte Rückseite (74) einschließt, und weiter einen Fußteil (80) einschließt, der sich von der Rückseite desselben nach außen erstreckt; und daß die Stopfenanbringvorrichtung (36) eine Halteplatte (54) einschließt, wobei die Halteplatte eine darin gebildete Öffnung (70) besitzt, wobei die Öffnung (70) angepaßt ist, um das Fußteil (80) des Ventilstopfens (34) aufzunehmen um das Anbringen des Stopfens (34) auf der Oberfläche der Platte zu erlauben, wobei der Durchmesser der Halteplattenöffnung (70) größer ist, als der Durchmesser des Stopfenfußteils (80); und daß das Klappenventil weiter Mittel (82) zum Sichern des Fußteils (80) innerhalb der Halteplattenöffnung einschließt.

4. Ein Klappenventil nach Anspruch 3, dadurch gekennzeichnet, daß das Fußteil (80) des Ventilstopfens (34) ein freies Ende einschließt; und daß der Stopfen (34) weiter einen Rückhaltekopf (82) einschließt, wobei der Rückhaltekopf (82) auf dem freien Ende des Stopfenfußteils (80) angebracht ist, wobei der Rückhaltekopf (82) einen größeren Durchmesser als denjenigen der Halteplattenöffnung (70) besitzt.

5. Ein Klappenventil nach Anspruch 1 oder 2, dadurch gekennzeichnet, daß der Ventilstopfen (34) eine Vorderseite (72), die mit dem Ventilsitz (32) in Eingriff tritt, und eine zur Vorderseite (72) entgegengesetzte Rückseite (74) einschließt, und weiter einen Fußteil (80), der sich von der Rückseite (74) desselben nach außen erstreckt, wobei der Fußteil (80) ein freies Ende besitzt, und einen auf dem freien Ende des Stopfenfußteils (80) angebrachten Rückhaltekopf (82) einschließt; und daß die Halteplatte (54) zwei entgegengesetzte Seiten (63,65) und eine durch die Dicke derselben gebildete Öffnung (70) besitzt, wobei die Öffnung (70) den Ventilstopfenfußteil (80) aufnimmt, so daß der Rückhaltekopf (82) und die

Vorderseite (72) auf entgegengesetzten Seiten der Halteplatte (54) angeordnet sind, wobei der Durchmesser der Halteplattenöffnung (70) größer als derjenige des Fußteils (80) und kleiner als derjenige des Rückhaltekopfes (82) ist.

6. Ein Klappenventil nach Anspruch 3, 4 oder 5, dadurch gekennzeichnet, daß die Vorderseite (72) des Ventilstopfens (34) aus einem im wesentlichen unelastischen Material gebildet ist.
7. Ein Klappenventil nach einem beliebigen der vorhergehenden Ansprüche, dadurch gekennzeichnet, daß der Ventilsitz (32) aus einem elastischen Material gebildet ist.
8. Ein Klappenventil nach Anspruch 1 oder 2, dadurch gekennzeichnet, daß der Ventilstopfen (34) eine Vorderseite (72) einschließt, die einen konisch geformten Teil (76) und einen den konisch geformten Teil (76) umgebenden Flansch (78) besitzt, und weiter eine zur Vorderseite (72) entgegengesetzte Rückseite (74) einschließt, wobei die Vorderseite (72) angepaßt ist, um mit dem Ventilsitz (32) in Eingriff zu treten.
9. Ein Klappenventil nach einem beliebigen der Ansprüche 3, 4 oder 5, dadurch gekennzeichnet, daß die Rückseite (74) des Ventilstopfens (34) einen vertieften Teil (84) einschließt.
10. Ein Klappenventil nach einem beliebigen der Ansprüche 1, 2 oder 8, dadurch gekennzeichnet, daß die Stopfanbringvorrichtung eine Halteplatte (54) einschließt, wobei die Halteplatte (54) im Gehäuse (6) schwenkbar angebracht ist und den Ventilstopfen (34) darauf angebracht besitzt, und vorbelastet ist, um den Ventilstopfen in Eingriff mit dem Ventilsitz (32) zu schwenken.
11. Ein Klappenventil nach einem beliebigen der Ansprüche 1, 2, 8 oder 9, dadurch gekennzeichnet, daß der Ventilstopfen (34) ein Fußteil (80) einschließt, das sich aus einer Oberfläche desselben erstreckt, wobei das Fußteil (80) in einer in der Stopfanbringvorrichtung (36) gebildeten Öffnung (70) lose aufgenommen ist.
12. Ein Klappenventil nach einem beliebigen der vorhergehenden Ansprüche, dadurch gekennzeichnet, daß der Ventilsitz (32) einen die Öffnung umgebenden Teil (50) mit verringerter Dicke besitzt.
13. Ein Klappenventil nach einem beliebigen der vorhergehenden Ansprüche, dadurch gekennzeichnet,

daß der Ventilsitz (32) derart im Gehäuse (6) angeordnet ist, daß die Ventilsitzöffnung (48) koaxial mit der Kanüle (4) ist.

14. Eine Insufflationskanülen-Anordnung (2), welche umfaßt:
 - eine Kanüle (4), wobei die Kanüle entgegengesetzte Enden besitzt;
 - ein auf einem Ende der Kanüle angebrachtes Gehäuse (6), wobei das Gehäuse eine darin gebildete Öffnung (10) besitzt; und ein im Gehäuse (6) angebrachtes Klappenventil, wobei das Klappenventil einen Ventilsitz (32) einschließt, der an der Gehäuseöffnung (10) angeordnet ist und eine darin gebildete Öffnung (48) besitzt, um den Durchtritt eines chirurgischen Instruments durch diese hindurch und in die Kanüle (4) zu erlauben, einen Ventilstopfen (34) der angepaßt ist, um mit dem Ventilsitz (32) an der Öffnung (48) desselben in Eingriff zu treten und mit dem Ventilsitz (32) eine im wesentlichen gasdichte Dichtung zu bilden; und eine Vorrichtung (36) zum Anbringen des Ventilstopfens (34) und um den Stopfen (34) in Eingriff mit dem Ventilsitz (32) und aus dem Eingriff heraus zu schwenken, und dadurch gekennzeichnet, daß der Ventilstopfen (34) auf der Stopfanbringvorrichtung (36) beweglich ist, so daß er gegenüber der Ventilsitzöffnung (48) selbstausrichtend ist, wenn der Stopfen (34) und der Ventilsitz (32) im Eingriff sind.
15. Ein Klappenventil nach einem beliebigen der vorhergehenden Ansprüche und wobei der Ventilsitz (32) umfaßt:
 - einen Ventilsitzkörper (32) der eine darin gebildete Ventilsitzöffnung (48) besitzt, die angepaßt ist, um ein Vordringen eines chirurgischen Instruments durch sie hindurch zu erlauben, wobei die besagte Öffnung durch eine Umfangsrippe (50) begrenzt ist, wobei mindestens ein Teil (52) der besagten Umfangsrippe von verringerter Dicke ist, wobei der besagte Teil (52) von verringerter Dicke dadurch von größerer Nachgiebigkeit ist, als angrenzende Teile des besagten Ventilsitzes, und angepaßt ist, um mit besagter Klappenventil-Anordnung eine im wesentlichen gasdichte Dichtung zu bilden.
16. Ein Ventil nach Anspruch 15, dadurch gekennzeichnet, daß die besagte Umfangsrippe aus einem nachgiebigen Material gebildet ist.
17. Ein Ventil nach Anspruch 15 oder 16, dadurch gekennzeichnet, daß der Ventilsitzkörper aus einem nachgiebigen Material gebildet ist.

18. Ein Ventil nach einem der Ansprüche 15, 16 oder 17, und welches geeignet ist, in eine Insufflationskanülen-Anordnung eingebaut zu werden, die eine einen Kanülendurchlaß (8) umschließende Kanüle (4) und ein Gehäuse (6) einschließt, das auf einem Ende der Kanüle angebracht ist und eine darin gebildete Gehäuseöffnung (10) für den Ventilsitz besitzt, wobei das Klappenventil bei der Verwendung im Gehäuse der Anordnung an die Gehäuseöffnung angrenzend angebracht ist, und wobei das Klappenventil einschließt:

eine in dem besagten Gehäuse schwenkbar angebrachte Ventilplatte (54), wobei die besagte Ventilplatte Vorder- und Rückseite (73) besitzt, wobei die besagte Vorderseite der besagten Ventilplatte angepaßt ist, um mit der besagten Umfangsrippe des besagten Ventilsitzes in Eingriff zu treten, wobei die besagte Ventilplatte Mittel (34) einschließt, um die besagte Ventilsitzöffnung (48) zu verschließen, wenn die besagte Ventilplatte mit der besagten Umfangsrippe in Eingriff tritt; und

Vorbelastungsmittel (58), um besagte Ventilplatte in Eingriff mit besagter Umfangsrippe des besagten Ventilsitzes vorzubelasten;

wodurch eine im wesentlichen gasdichte Dichtung zwischen dem besagten Ventilsitz und der besagten Ventilplatte bewirkt wird, wenn die besagte Umfangsrippe des besagten Ventilsitzes mit der besagten Vorderseite der besagten Ventilplatte im Eingriff steht.

19. Ein Ventil nach Anspruch 18, dadurch gekennzeichnet, daß die besagte Ventilplatte im wesentlichen U-förmig ist.

20. Ein Ventil nach Anspruch 18 oder 19, dadurch gekennzeichnet, daß der besagte Ventilsitz mit dem Gehäuse im Eingriff steht und darin durch einen Flansch (12) in seiner Lage gehalten wird.

21. Ein Ventil nach Anspruch 20, dadurch gekennzeichnet, daß der besagte Ventilsitz mit dem besagten Flansch auf einer Fläche im Eingriff steht, die ausreichend groß ist, um einen Gasaustritt dazwischen zu verhindern.

22. Ein Ventil nach einem beliebigen der Ansprüche 15 bis 21, dadurch gekennzeichnet, daß der besagte Teil mit verringerter Dicke angepaßt ist, um sich an die Gestalt der besagten Verschlusmittel anzupassen, um mit diesen eine im wesentlichen gasdichte Dichtung zu bilden.

23. Eine Insufflationskanülen-Anordnung, welche ein Ventil, wie in einem beliebigen der Ansprüche 18 bis 22 beansprucht einschließt und die umfaßt:

eine Kanüle (4) mit entgegengesetzten Endteilen;

ein an einem Ende der Kanüle angebrachtes Gehäuse (6), wobei das besagte Gehäuse eine darin gebildete Gehäuseöffnung (10) besitzt, wobei der Ventilsitz (32) an die Gehäuseöffnung angrenzt, und die Ventilsitzöffnung (48) mit dem Kanülendurchlaß in Verbindung steht und angepaßt ist, um den Durchtritt eines chirurgischen Instruments durch sie hindurch und in den Kanülendurchlaß zu erlauben.

Revendications

1. Vanne pivotante ou à clapet pour un assemblage d'insufflation par canule, l'assemblage de canule (2) comprenant une canule (4) définissant un passage de canule (8) et un logement (6) monté sur une extrémité de la canule (4) et possédant une ouverture (10) pratiquée dans celui-ci, la vanne pivotante étant montée dans le logement (6) de l'assemblage (2), la vanne pivotante comprenant :

un siège de vanne (32) situé à l'ouverture du logement (10), le siège de vanne (32) possédant une ouverture (48) pratiquée dans celui-ci, l'ouverture (48) du siège de vanne étant en communication avec le passage de canule (8) et étant conçue pour permettre le passage d'un instrument chirurgical à travers celle-ci et dans le passage de canule (8);

une bonde à vanne (34), la bonde à vanne (34) étant destinée à venir en prise avec le siège de vanne (32) à l'ouverture (48) de celui-ci et de former avec celui-ci un joint essentiellement étanche au gaz;

des moyens de sollicitation (58) pour solliciter la bonde à vanne (34) en prise avec le siège de vanne (32); et

des moyens (36) pour monter la bonde à vanne (34) dans le logement (6) et pour faire pivoter la bonde (34) en et hors prise avec le siège de vanne (32), caractérisée en ce que la bonde à vanne (34) est déplaçable sur le moyen de montage de bonde (36) de façon à s'auto-aligner avec l'ouverture de siège de vanne (48) lorsque la bonde (34) et le siège (32) sont en prise.

2. Vanne pivotante selon la revendication 1, dans laquelle la bonde à vanne (34) présente une face avant possédant une portion de forme tronconique (76) qui vient en prise avec le siège de vanne (32).

3. Vanne pivotante selon la revendication 1 ou 2, dans laquelle la bonde à vanne (34) comprend une face avant (72) qui vient en prise avec le siège de vanne (32), et une face arrière (74) opposée à la face avant (72), et comprend en outre une portion de tige (80) s'étendant vers l'extérieur depuis la face arrière de celle-ci; et dans laquelle le moyen de montage de bonde (36) comprend une plaque de support (54), la plaque de support présentant une ouverture (70) pratiquée dans celle-ci, l'ouverture (70) étant destinée à recevoir la portion de tige (80) de la bonde à vanne (34) pour permettre que la bonde (34) soit montée sur la surface de la plaque, le diamètre de l'ouverture de plaque de support (70) étant plus grand que le diamètre de la portion de tige de bonde (80); et dans laquelle la vanne pivotante comprend en outre des moyens (82) pour fixer la portion de tige (80) à l'intérieur de l'ouverture de plaque de support.
5
10
15
20
4. Vanne pivotante selon la revendication 3, dans laquelle la portion de tige (80) de la bonde à vanne (34) comprend une extrémité libre; et dans laquelle la bonde (34) comprend en outre une tête de retenue (82), la tête de retenue (82) étant montée sur l'extrémité libre de la portion de tige de bonde (80), la tête de retenue (82) possédant un plus grand diamètre que celui de l'ouverture (70) de la plaque de support.
25
30
5. Vanne pivotante selon la revendication 1 ou 2, dans laquelle la bonde à vanne (34) comprend une face avant (72) qui vient en prise avec le siège de vanne (32), et une face arrière (74) opposée à la face avant (72) et comprend en outre une portion de tige (80) s'étendant vers l'extérieur depuis la face arrière (74) de celle-ci, la portion de tige (80) présentant une extrémité libre, et une tête de retenue (82) montée sur l'extrémité libre de la portion de tige de bonde (80); et dans laquelle la plaque de support (54) présente deux côtés opposés (63,65) et a une ouverture (70) pratiquée à travers l'épaisseur de celle-ci, l'ouverture (70) recevant la portion de tige de bonde à vanne (80), de sorte que la tête de retenue (82) et la face avant (72) sont disposées sur des côtés opposés de la plaque de support (54), le diamètre de l'ouverture (70) de la plaque de support étant plus grand que celui de la portion de tige (80) et étant plus petit que celui de la tête de retenue (82).
35
40
45
50
55
6. Vanne pivotante selon la revendication 3, 4 ou 5, dans laquelle la face avant (72) de la bonde à vanne (34) est réalisée en un matériau essentiellement non élastique.
7. Vanne pivotante selon l'une des revendications précédentes, dans laquelle le siège de vanne (32) est réalisé en un matériau élastique.
8. Vanne pivotante selon la revendication 1 ou 2, dans laquelle la bonde à vanne (34) comprend une face avant (72) présentant une portion de forme conique (76) et un rebord (78) entourant la portion de forme conique (76), et comprend en outre une face arrière (74) opposée à la face avant (72), la face avant (72) étant destinée à venir en prise avec le siège de vanne (32).
9. Vanne pivotante selon l'une des revendications 3, 4 ou 5, dans laquelle la face arrière (74) de la bonde à vanne (34) comprend une portion évidée (84).
10. Vanne pivotante selon l'une des revendications 1, 2 ou 8, dans laquelle le moyen de montage de bonde comprend une plaque de support (54), la plaque de support (54) étant montée de façon pivotante dans le logement (6) et présentant la bonde à vanne (34) montée sur celle-ci, et étant sollicitée pour faire pivoter la bonde à vanne en prise avec le siège de vanne (32).
11. Vanne pivotante selon l'une des revendications 1, 2, 8 ou 9, dans laquelle la bonde à vanne (34) comprend une portion de tige (80) s'étendant depuis une surface de celle-ci, la portion de tige (80) étant reçue lâchement dans une ouverture (70) formée dans le moyen de montage de bonde (36).
12. Vanne pivotante selon l'une des revendications précédentes, dans laquelle le siège de vanne (32) présente une portion d'épaisseur réduite (50) entourant l'ouverture.
13. Vanne pivotante selon l'une des revendications précédentes, dans laquelle le siège de vanne (32) est situé dans le logement (6) de sorte que l'ouverture de siège de vanne (48) est coaxiale avec la canule (4).
14. Assemblage d'insufflation par canule (2) qui comprend :
une canule (4), la canule présentant des extrémités opposées;
un logement (6) monté sur une extrémité de la canule, le logement présentant une ouverture (10) formée sur celle-ci; et une vanne

- pivotante montée dans le logement (6), la vanne pivotante comprenant un siège de vanne (32) disposé à l'ouverture de logement (10) et présentant une ouverture (48) pratiquée dans celui-ci pour permettre le passage d'un instrument chirurgical à travers celle-ci et dans la canule (4), une bonde à vanne (34) apte à venir en prise avec le siège de vanne (32) à l'ouverture (48) de celui-ci et à former avec le siège de vanne (32) un joint essentiellement étanche au gaz; et des moyens (36) pour monter la bonde à vanne (34) et pour faire pivoter la bonde (34) en et hors prise avec le siège de vanne (32), caractérisé en ce que la bonde à vanne (34) est déplaçable sur le moyen de montage de bonde (36) de façon à pouvoir s'auto-aligner avec l'ouverture de siège de vanne (48) lorsque la bonde (34) et le siège de vanne (32) sont en prise.
15. Vanne pivotante selon l'une des revendications précédentes et dans laquelle le siège de vanne (32) comprend:
- un corps de siège de vanne (32) dans lequel il est pratiquée une ouverture de siège de vanne (48) destinée à permettre l'avance d'un instrument chirurgical à travers celle-ci, ladite ouverture étant délimitée par une lèvre périphérique (50), au moins une portion (52) de ladite lèvre périphérique ayant une épaisseur réduite, ladite portion d'épaisseur réduite (52) ayant une plus grande flexibilité que des portions adjacentes dudit siège de vanne, et étant apte à former un joint essentiellement étanche au gaz avec ledit assemblage de vanne pivotante.
16. Vanne selon la revendication 15, dans laquelle ladite lèvre périphérique est réalisée en un matériau élastique.
17. Vanne selon la revendication 15 ou 16, dans laquelle le corps de siège de vanne est réalisé en un matériau élastique.
18. Vanne selon la revendication 15, 16 ou 17 et qui convient pour être incorporée dans un assemblage d'insufflation par canule, qui comprend une canule (4) définissant un passage de canule (8) et un logement (6) monté sur une extrémité de la canule et dans lequel est pratiquée une ouverture de logement (10) pour le siège de vanne, la vanne pivotante en cours d'utilisation étant montée dans le logement de l'assemblage adjacent à l'ouverture de logement, et la vanne pivotante comprenant :
- une plaque de vanne (54) montée de façon pivotante dans ledit logement, ladite plaque de vanne présentant des faces avant et arrière (63), ladite face avant de ladite plaque de vanne étant apte à venir en prise avec ladite lèvre périphérique dudit siège de vanne, ladite plaque de vanne comprenant des moyens (34) pour obstruer ladite ouverture de siège de vanne (48) lorsque ladite plaque de vanne vient en prise avec ladite lèvre périphérique; et
- des moyens de sollicitation (58) pour solliciter ladite plaque de vanne en prise avec ladite lèvre périphérique dudit siège de vanne;
- par quoi un joint essentiellement étanche au gaz est effectué entre ledit siège de vanne et ladite plaque de vanne lorsque ladite lèvre périphérique dudit siège de vanne vient en prise avec ladite face avant de ladite plaque de vanne.
19. Vanne selon la revendication 18, dans laquelle ladite plaque de vanne a une forme essentiellement en U.
20. Vanne selon l'une des revendications 18 ou 19, dans laquelle ledit siège de vanne vient en prise avec le logement et est maintenue en position à l'intérieur par un rebord (12).
21. Vanne selon la revendication 20, dans laquelle ledit siège de vanne vient en prise avec ledit rebord sur une zone suffisante pour empêcher une fuite de gaz entre ceux-ci.
22. Vanne selon l'une des revendications 15 à 21, dans laquelle ladite portion à épaisseur réduite est conçue pour se conformer à la configuration dudit moyen d'obstruction pour former un joint essentiellement étanche au gaz avec lui.
23. Assemblage d'insufflation par canule qui comprend une vanne selon l'une des revendications 18 à 22 et qui comprend :
- une canule (4) présentant des portions extrêmes opposées,
- un logement (6) monté sur une extrémité de la canule, ledit logement présentant une ouverture de logement (10) pratiquée dans celui-ci, le siège de vanne (32) étant adjacent à l'ouverture de logement, et l'ouverture de siège de vanne (48) étant en communication avec le passage de canule et étant conçue pour permettre le passage d'un instrument chirurgical à travers celle-ci et dans le passage de canule.
